PROJECTS

DeepGroebner (code available upon request) Applications of reinforcement learning to Gröbner basis computation using SymPy and TensorFlow. Used in publication [1].

DifSets (<https://github.com/dylanpeifer/difsets>) A refereed package for GAP that efficiently implements an exhaustive search for difference sets using group theory and dynamic programming. Presented in publication [2] and used in [3].

FGLM (with Mahrud Sayrafi, <https://github.com/dylanpeifer/FGLM>) An accepted package for Macaulay2 that implements the FGLM algorithm for efficiently computing Gröbner bases of zero-dimensional ideals.

GroebnerWalk (<https://github.com/dylanpeifer/GroebnerWalk>) An accepted package for Macaulay2 that implements the standard and generic Gröbner walk algorithm for efficiently computing Gröbner bases.

Macaulay2 (contributor, <https://github.com/Macaulay2/M2>) A system for computing in commutative algebra, algebraic geometry and related fields.
